

SUMMARY

Air basin pollution aspects /GELGAUDIŠKIS

By Donatas Perkauskas

Environment Protection Agency

The local transport-caused air pollution in Gelgaudiškis, situated at the Lower Nemunas, is greatly influenced by meteorological conditions. The pollution increases when temperature inversions and mist form. The CO concentration is less than allowable, i. e. 5 mg/m³. From the air pollution point of view Gelgaudiškis may be assigned to the cleaner little towns at the Nemunas River. The town and its environs are suitable for developing recreation and tourism.
